2. Scenario: You are a data analyst working for a company that sells products online. You have

been tasked with analyzing the sales data for the past month. The data is stored in a NumPy array.

Question: How would you find the average price of all the products sold in the past month?

Assume 3x3 matrix with each row representing the sales for a different product..

Code;

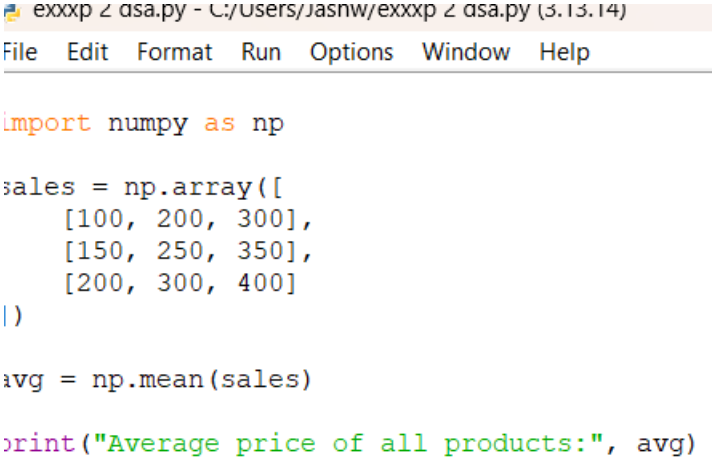

```
import numpy as np

sales = np.array([
    [100, 200, 300],
    [150, 250, 350],
    [200, 300, 400]
])

avg = np.mean(sales)

print("Average price of all products:", avg)
```

Input;

OutPut;

Average price of all products: 250.0
